- **Cover:** decimal values can be entered
- **Caves:** for habitat types 8310, 8330 (caves) enter the number of caves if estimated surface is not available.
- **Data quality:** G = 'Good' (e.g. based on surveys); M = 'Moderate' (e.g. based on partial data with some extrapolation); P = 'Poor' (e.g. rough estimation)

3.2 Species referred to in Article 4 of Directive 2009/147/EC and listed in Annex II of Directive 92/43/EEC and site evaluation for them

Other Site Characteristics

Si tratta di un lungo promontorio che si protende nel Mar Tirreno ed è caratterizzato da scogliere e falesie di natura calcarea. Il bioclimate è di tipo mediterraneo con termotipo termomediterraneo superiore e ombrotipo subumido inferiore. La vegetazione è prettamente rupicola con aspetti alofili dei Crithmo-Limonetea caratterizzati dalla presenza di Limonium minutiflorum, specie endemica. Si rinvencono anche aspetti casmofili sulle falesie rocciose e aspetti di macchia ad Euphorbia dendroides.

4.2 Quality and importance

Questo promontorio, per la spettacolarità dei suoi habitat rocciosi costieri, unici in tutta l'area della Sicilia nord-orientale, mostra un notevole valore paesaggistico e naturalistico. Qui si trovano anche diverse entità che nell'area regionale sono rare o ritenute di rilevante interesse fitogeografico, a loro volta menzionate nell'elenco riportato nella sezione 3.3 (D). Ospita un habitat di particolare interesse, alcuni dei quali sono utilizzati da Rapaci come posatoi o come aree di foraggiamento.
